

VIBE CODE MARATHON – HEALTH TEAM BUILD

Product Name

- **AI Maternal Health Operating System (AMHOS)**

What It Is (Brief Details)

AMHOS is a mobile, web, and cloud-native software-as-a-service (SaaS) platform designed as an **offline-first, interoperable digital operating layer** for maternal and newborn care coordination. It connects pregnant women, community health workers (CHWs), clinics, hospitals, and emergency transport providers into a unified, real-time workflow using actionable data and advisory AI risk stratification.

Core Benefits to Africa

The platform is designed to tackle the high burden of maternal and newborn mortality across African countries by addressing systemic healthcare delivery bottlenecks:

- **Reduces Preventable Mortality:** By replacing fragmented paper, SMS, and siloed app workflows with a unified digital pathway, it ensures every pregnancy is registered, risk-triaged early, and followed up.
- **Strengthens Community-to-Facility Coordination:** It bridges the gap between rural community health workers and clinical facilities, automating task scheduling and orchestrating postnatal checks within the critical 48-hour postpartum window.
- **Provides Reliable Offline-First Technology:** Designed specifically for low-connectivity and resource-constrained environments, the mobile application functions seamlessly offline and queues data locally until connection is restored.
- **Enhances Referral and Transport Efficiency:** It provides receiving hospitals with advance visibility into incoming high-risk cases and tracks referral timelines, minimizing dangerous delays in transit.
- **Equips Administrators with Real-Time Data:** It provides district and national health stakeholders with live operational dashboards instead of delayed retrospective reports, facilitating targeted public health interventions.
